Abstract - Wakurde lift irrigation scheme is under Maharashtra Krishna Valley Development Corporation (MKVDC). A scheme is located in Wakurde of Sangali district, Maharashta State, India. It is major ongoing irrigation project of Krishna basin basically implemented for irrigating areas of Shirala and Valava Tal. in Sangali district also Karad Tal. in Satara district. Techno-economic viability of project is one of the important key factor having significant contribution in success of lift irrigation scheme. The aim of this study is to check economic feasibility of LIS and asses it's social impact, as it is important to know that whether the project is beneficial or not. For this purpose, we calculated the economic feasibility and sanctioning of projects by working out benefit to cost ratio and Internal Rate of Return (IRR). The purpose of this study is to overcome problems is execution and cost-time overruns. We assessed actual facts and problems in implementation of this LIS. We also studied practical irregularities while running this scheme. In this study suggestions are given to improve efficiency of project and to overcome actual on field problems.

Key Words: MKVDC, economic feasibility, socio-economic impact, Lift Irrigation System, cropping pattern, benefit to cost ratio.

1. INTRODUCTION

Wakurde Lift Irrigation Scheme is under Warana Irrigation Project which is located on Warana River in Krishna basin. It is proposed to lift water from (LBC) Left Bank Canal of Warana project. It consists of main 2 parts and again first part divided into 3 stages and second part is divided into 2 stages. As per the original standard approved by the Corporation in 1998, it was planned to irrigate 15775 hectares of irrigated area by pumping water in one area in 3 phases. As per the proposed second RAA of this scheme, a total irrigated area of 28,035 hectares is proposed to be irrigated as 12,275 ha in 3 phases under Part 1 and 15,760 ha in 1 phase under Part 2. Total cultivated command area of Wakurde LIS project is 33,062 ha. running text. The order of reference in the running text should match with the list of references at the end of the paper. Out of that irrigable command area is 28,035 ha. The crop structure proposed in the first RAA approved was 126% and 123% for Sangli East and Sangli West respectively. It had 20% cane crop for both the regions. According to the proposed crop structure, 173.36 gallons of water is required for Modified Penman method for irrigation. An economic feasibility of project is worked out by Benefit to Cost ratio (B/C ratio) and Internal Rate of Return (IRR) methods which are considered as economic analysis methods.

1.1 Necessity

India's ultimate irrigation potential is 140 million hacters but only 87 million hacters is utilized through major, medium, minor irrigation project and ground water. This gap can be reduced by using irrigation system of higher water use efficiency. The conventional method for conveying water for irrigation in India has certain limitations as evaporation losses, seepage losses, land acquisition and thefts. In order to overcome these drawbacks, pipe distribution network system is best alternative. It is necessary to search innovative alternative for modernization of existing water distribution network system.

There are various irrigation methods available but an importance of 'Lift Irrigation Scheme' is unique. The total 8% LIS of Maharashtra irrigates 22000 ha of land which finances Rs. 6462.5 million. Basically, lift irrigation schemes are used to lift water from lower level to higher level mainly consists of water sources (such as dams, K.T.weirs, river canals), lifting medium and conveying medium. Dams and canals are constructed to increase irrigated area at lower level than dam level but scarcity of water remained the problem for higher areas.

India is mainly an agricultural country and water resources plays vital role in irrigation. Now a days, industrialization demands for more water availability which leads to reduce water available for irrigation. Stress due to water scarcity increasing day by day. To reduce this water scarcity and meet rapid water demand of irrigation, adoption of new irrigation methods is essential. Warna and Krishna rivers are two major rivers which flow in Maharashtra state and are linked together by Wakurde LIS in Tal-Shirala, Dist-Sangali.

1.2 Objectives

- 1. To understand/examine water distribution scenario of Wakurde LIS.
- 2. To check economic viability of Wakurde LIS.
- 3. To asses socio-economic impact of scheme.
- 4. To recommend measures to be taken to increase planned benefits.

1.3 Methodology

- 1. Study of Wakurde LIS.
- 2. Data collection from Water Resource Department relevant to objectives.
- 3. Critical study of collected data with respect to financial aspects.
- 4. Finding out Benefit to Cost ratio (B/C) and Internal Rate of Return (IRR).
- 5. Checking economic feasibility of scheme.
- 6. Results and conclusion.

2. PROJECT DETAILS

2.1 Overview of Scheme

Wakurde lift Irrigation Scheme is located in Tal. Wakurde of Sangali district. It is an ongoing major irrigation project of Krishna basin. Wakurde Lift Irrigation Scheme is in the 'Rest of Maharashtra Krishna Valley Development Corporation'. Wakurde LIS is implemented by pumping 2.77 per unit of water annually in left canal of Warana project. There are three phases of 24 km canal which is in Shirala Tal. Sangali Dist., Valva tal. Sangali Dist. and Karad of Satara Dist.

State level technical advisory committee's feedback about this project is as follows.

- 1. Approved Basic Scheme As per the original standard approved by the Corporation in 1998, it was planned to irrigate 15775 hectares of irrigated area by pumping water in one area in 3 phases. It covers 6380 hectares in Shirala Tal. of Sangli district, 7195 hectares in Valva Tal. and 2200 hectares in Satara district. It was proposed to use 4.60 TMC of water.
- 2. Approved First RAA The scheme was approved by the corporation in the year 2004 by incorporating Part 2 as per the first RAA and giving joint approval for Part 1 and Part 2. Accordingly, the total irrigated area under the Part I was 5700 hectares in 3 phases and 13875 hectares under Part 2 in 1958 hectare. It was proposed to use 5.88 TMC water. It covers 3500 hectares in Shirala Tal. of Sangli district, 13275 hectares in Valva Tal. and 2200 hectares-- in Karad Tal. of Satara district.
- 3. Proposed Second RAA As per the proposed second RAA of this scheme, a total irrigated area of 28,035 hectares is proposed to be irrigated as 12,275 ha in 3 phases under Part 1 and 15,760 ha in 1 phase under Part 2. For this 6.12 TMC water is proposed to be used. It covers 7270hectares in Shirala taluka of Sangli district, 18565 hectares in Valva taluka and 2200 hectares in Karad taluka of Satara district.

There are three phases of left bank 24 km canal as: 6515 ha.in Tal. Shirala of Dist. Sangali,3560 ha. in Tal. Walva of Dist. Sangali & 2200 ha. in Tal. Karad of Dist. Satara .It is planned to irrigate a total area of 12275 ha. The details are given below:

Table 3.4.1 Area to be irrigated

Sr.No.	Taluka /District	Part-1 Area (ha.)	Part-2 Area (ha.)	Total area (ha.)
1	Shirala Dist. Sangli	6515	755	7270
2	Karad Dist. Satara	2200		2200
3	Valva Dist. Sangli	3560	15005	18565
	Total	12275	15760	28035

2.2 Administrative Approval Details

The detail original administrative approval of the project, the first Revised Administrative Approval (RAA) and proposed administrative approval areas are as follows:

Table 3.4.2 Details of Administrative Approval

Sr.	RAA	Details of recognition	Year of Tariff	Amount (Rs.Crore)	Irrigation Area (ICA)(Ha)	Water consumption per unit
1)	Administrative approval	M.Lost Vs. M.Decision No.Wakurde/Usinyo/ MP2/Prama298/ (956/98)6991 dated 9/12/1998	1995- 96	109.68	15775	4.60
2)	First RAA	DecisionMakrikhoviman /MP3/Wakurdeusinyo/8 560 dated 25/10/2004	2003-	332.31	19575	5.88
3)	Second RAA	As proposed	2018- 19	888.07	28035	6.12

At the end of March 2020, Rs.211.67 crore i.e.23.83% of the updated price and 63.70% of the sanctioned RAA amount has been spent.

3. METHODOLOGY OF THE PROJECT

A critical analysis of Wakurde LIS is to be carried out in two phases as follows:

- 1. Economic Feasibility Analysis
- 2. Socio- economic study of Wakurde LIS

3.1 Phase 1: Economic Feasibility Analysis of Project

There are several methods used to check economic viability of project. From these methods two methods are used in this study are as follows:

- 1. Benefit to Cost (B/C) ratio which is also known as profitability index.
- 2. Internal Rate of Return (IRR)

Economical feasibility study of the project

The economic feasibility is the analysis of the costs and returns from a project with respect to determine whether project is logical or not and possible to complete it. It is one of the cost-benefit analysis of the considered project, which concludes that whether the project is possible to implement or not. The economic feasibility analysis is the mostly used to decide the efficiency of a new project. It is also known as cost analysis. It helps to identify the expected return against an amount invested in the considered project.

e-ISSN: 2395-0056 p-ISSN: 2395-0072

For this, two types of costs are calculated which are known as development cost and operating cost. By considering future value of the project, an approximate time span to receive the returns against the investment is also calculated. Economic feasibility study helps to identify how well or how poorly a project will perform.

3.1.1 Benefit-Cost Ratio (B/C)

The benefit cost ratio is calculated by dividing the present value of benefits by that of costs and investments.

$$BCR = \frac{|PV \ [Benefits]|}{|PV \ [Cost]|} = \frac{\sum_{t=0}^{N} \frac{|CF_t [Benefits]|}{(1+i_t)^t}}{\sum_{t=0}^{N} \frac{|CF_t [Costs]|}{(1+i_t)^t}}$$

Formula for Benefit to Cost Rat

Where:

BCR = Benefit Cost Ratio

PV = Present Value

CF = Cash Flow of a period (classified as benefit and cost, respectively)

i = Discount Rate or Interest Rate

N = Total Number of Periods

t = Period in which the Cash Flows occur

Note: In this formula, both present values need to be inserted with their absolute, non-negative amounts. If we consistently used negative cash flows for either the cost or the benefit side, result will be negative, then need to multiply it with (-1).

The benefit-cost ratio (BCR) is also known as Profitability Index. A profitability indicator used in cost-benefit analysis to determine the viability of cash flows generated from an asset or project. The BCR compares the present value of all benefits generated from a project/asset to the present value of all costs. A BCR exceeding one indicates that the asset/project is expected to generate incremental value.

Criteria for Benefit to Cost Ratio

Range of (B/C) Ratio	Profitability Index
BCR < 1	Investment will not be profitable.
BCR= 1	Investment is neither profitable nor loss.
BCR > 1	Investment will be profitable.

3.1.2 Internal Rate of Return (IRR)

The internal rate of return can be defined as the rate which equates the present value of cash inflows with the present value of cash outflows of an investment. Internal rate of return is the rate at which the net present value of the investment is zero. It is called internal rate because it depends only on the outlay.

$$C_0 = \frac{C_1}{(1+r)} + \frac{C_2}{(1+r)^2} + \frac{C_3}{(1+r)^3} + \dots + \frac{C_n}{(1+r)^n}$$

$$C_0 = \sum_{t=1}^n \frac{C_t}{(1+r)^t}$$

$$= \sum_{t=1}^n \frac{C_t}{(1+r)^t} - C_0 = 0$$

Formula for Internal Rate of Return (IRR)

Volume: 10 Issue: 03 | Mar 2024

www.irjet.net

IRR higher than the discount rate signifies that investment is profitable. Internal rate of return (IRR) is the percentage of returns that a project will generate within a time period to cover its initial investment. Internal rate of return (IRR) is the discount rate at which a project's returns become equal to initial. It is the rate when the Net Present Value amounts to zero. It facilitates the comparison of different investment options and projects.

3.2 Phase 2: Socio- Economic Study of Wakurde LIS

In this phase of project, Socio-economic study is carried out with following aspects:

- To asses socio-economic impact of scheme.
- To recommend measures to be taken to increase planned benefits.
- 1. Assessment of socio-economic impact:

For an assessment of socio-economic impact of scheme, following points are to be studied:

- For which factors LIS will be feasible and factors affecting feasibility of LIS
- How LIS affects on environmental factors and on social factors, also it's economic impact.
- Measures to be taken to improve planned benefits:
 - Actual problems in implementation of LIS are found out by overall study.
 - Overall analysis is carried out to overcome these drawbacks then suggestions are given to improve benefits from LIS project.
 - In which case, implementation of Wakurde LIS will be economical and efficient.
 - How PDN (Pipe Distribution Network) is beneficial over CDN (Canal Distribution Network)

4. DATA COLLECTION AND CALCULATION

4.1 Method 1. Annual Cost and Benefit Cost Ratio of Project

4.1.1 Cost of the project

The total cost of the scheme consists of the following:

- 1. Fixed cost or investment cost.
- 2. Operating cost.
- 3. Maintenance cost.

Table 4.1.1 Cost of the project

Sr. No.	Particulars	Total Amount Rs. Lakhs

The proposed crop composition of the project has been received as per the letter No.48/2009, dated 03/01/2009 of District Superintendent of Agriculture, Sangli and is being approved by the Commissioner of Agriculture, Pune. According to the proposed crop structure, 173.36 gallons of water is required for Modified Penman method for irrigation.

State level technical advisory committee's feedback

Volume: 10 Issue: 03 | Mar 2024

The crop structure proposed in the first RAA approved was 126% and 123% for Sangli East and Sangli West respectively. It had 20% cane crop for both the regions. Approved by letter dated 2009. The area under that crop has been reduced by 10% for both the areas and the percentage of other crops has been changed to 126% and 123% for Sangli East and Sangli West respectively.

Net Benefit For 6515 Hectare

= 1197.59 × 7270 ÷ 1000= 8706.49 (Rs.In lakhs)

Calculation of total net benefit

- 1. Net benefit for Sangali (East) = 27301.33 (Rs.InLakhs)
- 2. Net benefit for Sangali (West) = 8706.49 (Rs.In lakhs)
- 3. Total Net Benefit = (1 + 2) = 36007.82 (Rs.In lakhs)
- 4. Annual Net Benefits = 36007.82 14559.08 = 21448.74 (Rs.In lakhs)

Total Annual Benefits from project is 21448.74 (Rs.In lakhs)

Benefit Cost Ratio 4.1.5

Total cost of project calculated from 4.1.2 = 15026.95 (Rs.In lakhs)

Total Annual Benefits from project calculated from 4.1.4 = 21448.74 (Rs.In lakhs)

B.C.RATIO = Total Benefits/Total Cost $= 21448.74 \div 15026.95$ = 1.43

Hence Benefit to Cost (B/C) ratio for the project is 1.43

Method 2. Internal Rate Of Return

Here, Yearwise Net benefits of the project along with Internal Rate of Return is given:

Table 5.2. Internal Rate of Return

Sr. No.	Year	No.Of Years	Conve rtion factor for benefi t	Projec t Cost Exp.In Year	ICA devel oped in %	IP in (Ha)	O & M Cost	Total cost	Benefits	Yearw ise Conve rted benefi s	Net Benefit s

5. SOCIO-ECONOMIC ANALYSIS:

5.1 Factors Affecting Feasibility of Lift Irrigation/Water Supply Project:

- 1. Location of the scheme.
- 2. Availability of water in the river or the stream, with respect to irrigation seasons.
- 3. Number of existing irrigation and water supply projects on the same river or stream in both upstream and downstream sections of the proposed scheme.
- 4. Potential for additional pumping from the river without adversely affecting the water requirement of existing schemes/riparian users.
- 5. Suitability of water for irrigation/water supply.
- 6. Proposed cropping pattern/cropping intensity in the command area/water supply demands of the population.
- 7. The extent of land development work needed in the command area.
- 8. On-farm water conveyance system proposed (open channels/ underground pipelines). PDN over CDN The method of water application proposed (surface/sprinkler/drip).

5.2 Actual problems in practical application of LIS:

- 1. Crop pattern is not being followed by farmers
- 2. Operation of valves and pressure in pipes should be properly calculated.
- 3. Scouring of pipes and its maintenance
- 4. Distribution of water as per requirement
- 5. Continuous electricity supply is needed
- 6. Difficulties in flooding situation
- 7. Limitation on irrigation potential of particular water source
- 8. Dependency for land acquisition
- 9. Illiteracy of farmers may lead to improper operation of lift irrigation system

5.3 Suggestions / Recommendations To Improve Planned Benefits:

- 1. Crop patterns should be followed by farmers.
- 2. A technical authority should be appointed for execution and operation of water distribution system.
- 3. Regular inspection and maintenance should be carried out to check blockage in pipes.
- 4. Pressure should be checked properly while designing and operating lift irrigation system.
- 5. Cleaning of canals and sediment removal should be done periodically.
- 6. Distribution of water should be as per requirement and there should be check on wastage of water.
- 7. Pipe distribution network should be preferred over canal distribution system.

$5.4\ Advantages\ of\ using\ PDN\ (Pipe\ Distribution\ Network)\ over\ CDN\ (Canal\ Distribution\ Network)\ in\ LIS:$

Disadvantages of canal system

- 1. In stagnant and open water, there can be spread of mosquitoes, worms and insects.
- 2. There is theft of water from open canal, due to which there will be shortage of water as per requirement for genuine farmers.
- 3. The growth of weeds along canal sides and river bed.
- 4. If regular maintenance of canal is not done, hydraulic capacity of canal decreases due to sediment deposition.
- 5. Percentage increases in conveyance efficiency and distribution efficiency which minimizes losses

Volume: 10 Issue: 03 | Mar 2024 www.irjet.net p-ISSN: 2395-0072

e-ISSN: 2395-0056

Advantages of PDN over CDN

- 1. Water is distributed by pipes to entire area of farm. Hence, no significant amount of productive farm area is lost to crop production.
- 2. There are no transmission losses while supplying water also there is no leakage in pipeline system as it is water tight. As a result, there are no evaporation and seepage losses which lead to saving of water.
- 3. Drainage problems are reduced as there is no seepage.
- 4. Labour saving 25-50% less labour per unit area of irrigation for pipe distribution for the control of water in compare with open channel.
- 5. Permanence In pipe distribution network, a pipe network is properly designed, made of good quality materials and well constructed. It has long life span.
- 6. Ease of conveyance Water can be drawn directly from water supply source to outlet points mostly it is possible for undulating land. Water can be transported to areas such as across a depression or boosted uphill, which is not possible with open channels, unless an elaborate structure is built.
- 7. Low maintenance cost In case of open canals, earthen structures are to be built and maintained continuously but maintenance costs for pipe distribution structures are low, as the system is buried under ground
- 8. No channel block problems There is no obstruction to flow of water, no channels to become choked with weeds to hinder flow.
- 9. Better control there is better and easier control on the flow of water in case of pipes which leads to more efficient irrigation.
- 10. No hindrance to equipment There are few obstacles to hinder the movement of agricultural equipment and farm transport. This is an important feature where fields are small.
- 11. Full and effective control of irrigation water resulting into taking up of crop diversification such as horticulture, vegetables and other cash crops such as groundnut etc.

6. RESULT AND DISSCUSION

From Economic Analysis, for Wakurde Lift Irrigation Scheme, the total cost worked out to be Rs. 908.44 Crore that is 181000 Rs. per Hectare. Benefit Cost Ratio of the project is 1.43 which is nearly equal to 1.5 and is approved by corresponding Government authority. Hence project is efficient. Internal Rate of Return (IRR) of the project is 15.21% which is more than 12% which fits the project criteria. Hence the project is efficient and economically feasible.

From socio-economic analysis, the factors which affect feasibility of LIS are location, availability of water sources, proposed cropping pattern, water conveyance systems. Many points were came to notice while actual implementation of LIS such as operation of LIS, un following proposed cropping pattern, pressure in pipes, souring & maintenance of pipe distribution system, distribution of water, electricity supply, limitation on irrigation potential, problems in land acquisition, illiteracy of farmers.

7. CONCLUSION

The study concludes that B/C ratio of project is 1.43 which is nearly equal to 1.5 hence implementation of this project is profitable. Internal Rate of Return (IRR) for this project is worked out as 15.21% which is greater than 12.5% hence project will give profitable returns. From these two methods of economic feasibility study (Phase1), it is concluded that project is feasible.

Second phase of project is to assess socio-economic impact of scheme and recommend measures to increase planned benefits. From socio-economic study of Wakurde LIS, it is concluded that even if there are some problems in actual implementation of LIS, LIS is more efficient by using Pipe Distribution Network (PDN) also planned benefits will increase if implementation is carried out with recommended measures.
