^{2,3,4}Student, Department of Civil Engineering, PERI Institute of Technology, Chennai 48

Abstract - Economy in construction is the ultimate need for today, so we go for suitable structures to fit the purpose. The bridge uses floats (floating concrete) to support a continuous or separate deck for vehicle and pedestrian travel. It is used in the area where there is not feasible to suspend a bridge from anchored piers and also the area which has large deep sea bed. Pier-less bridge are not new to this world. During the Cholas period for their invasion across rivers, they made use of trained elephants that swim on the surface, over which they transported all elements of battle by laying planks over elephants. This paper also includes floating bridges which are pier less and whose design has been modified to bear heavy weight and possible to connect large distance and it is used in the area having heavy population. These bridges are made of suitable concrete sections and are continuous in length so that they could connect island and mainland even over sea which eliminates the cost of pier and makes the bridges more economic.

Keywords- Cross-passage, tunnel linings, Flyover, Floating bridge, Concrete.

1. INTRODUCTION

Floating bridges were even built in olden ages with the help of boat like structures as supporting piers at regular intervals and decks were placed on it. Here the entire bridge transfers its load due to buoyancy.

There are basically two types of very large floating structures (VLFSs), namely the semi-submersible-type and the pontoon-type. Semi-submersible type floating structures are raised above the sea level using column tubes or ballast structural elements to minimize the effects of waves while maintaining a constant buoyancy force. Thus they can reduce the wave-induced motions and are therefore suitably deployed in high seas with large waves. In pontoon type bridges are placed on the surface of the water.

Floating bridges are cost-effective solutions for crossing large bodies of water with unusual depth and very soft bottom where conventional piers are

impractical. As we propose to build a bridge across a natural drainage like rivers or some obstruction, we have to consider the height of piers constructed above the ground level as well as below the ground level as a part of foundation. When we lay piers for bridges crossing deeper rivers then the height of piers would be very large.

Even if the river bed is of soft bed rock then the depth up to which the piers have to be laid under the ground level as foundation is also so high. So as a whole it leads to a large excavation cost for drilling piles under water as well as constructing piers for such great heights. Even if we construct like this we must increase the dimensions of piers drastically to avoid buckling or go for many piers at shorter intervals to reduce the load over the piers. So in order to reduce the cost and make the bridge more economical we go for floating bridges now, which is made of concrete and it floats based on the principle of buoyancy.

A modern floating bridge may be constructed of wood, concrete, steel, or a combination of materials, depending on the design requirements. In our project we are using floating concrete to float the bridge structure. Figure 1 shows the floating concrete.

Fig. 1: Floating Concrete

United States, Canada, Norway, China and other Eastern countries have used this technology to create works of great importance and have brought a strong innovation in the sector. The first longest pontoon bridge in

the world (Figure2) is located in North America and support a large amount of heavy traffic also in extreme climatic conditions. In Norway we highlight the original combination of a floating bridge with a submerged tunnel.

In the Maldives an original floating bridge brilliantly reconciles the need for connection between two islands with landscape and environmental requirements. A conventional design would implicate several big foundations at the seabed which are not only costly and complex to build but also have a very negative impact on any life at the bottom of the ocean. Finally, the enlargement hypothesis of a pontoon bridge in China proves the vitality of this type of structure in a rapidly growing country.

3. ARCHIMEDES PRINCIPLE

Apparent Weight-Weight of Object in axis-Thrust force Equation

Mass of Liquid Displaced

$$\begin{aligned} \text{Mass} &= \text{Density} \times \text{Volume} \\ &= \rho \times V \end{aligned}$$

Weight of the Liquid Displaced

$$\begin{aligned} w &= m \times g \\ m &= \rho \times V \\ w &= \rho \times V \end{aligned}$$

From Archimedes

Apparent Loss of Weight = Weight of Water Displaced

Thus The Thrust Force is

$$\begin{aligned} \text{Thrust} &= \rho \times V \times g \\ V &= \text{length} \times \text{breadth} \times \text{depth} \\ \text{Length} &= 16\text{m} \\ \text{Breadth} &= 12\text{m} \\ \text{Depth} &= 7.6\text{m} \\ V &= 16 \times 12 \times 7.6 \\ &= 1459.2\text{m}^3 \\ \text{Thrust} &= 1000 \times 9.81 \times 1459.2 \\ &= 9810 \times 1459.2 \\ W &= 1431.75 \times 10^3 \text{ KN} \end{aligned}$$

The Dimensions of the pontoon can sustain 1431.75×10^3 KN capacity of load.

4. DESIGN OF DECK SLAB

STEP 1

Given Data

$$\begin{aligned} \text{Size of Slab} &= 22\text{m} \times 13.5\text{m} \\ \text{Depth of Slab} &= 0.60\text{m} \\ \text{Grade used M25, Fe500} & \\ \text{Live Load} &= 5 \text{ KN/mm}^2 \end{aligned}$$

STEP 2

Type of Slab

$$\begin{aligned} L_y/L_x &= 22/13.5 \\ &= 1.62 < 2 \end{aligned}$$

The Given Slab is Two Way Slab

STEP 3

Overall Depth

Assume Clear Cover is 30mm

$$\begin{aligned} D &= d + 0.03 \\ &= 0.6 + 0.03 \\ &= 0.63\text{m} \end{aligned}$$

STEP 4

Effective Span

$$\begin{aligned} L_y &= 22 + 0.6 \\ &= 22.6\text{m} \\ L_x &= 13.5 + 0.6 = 14.1\text{m} \end{aligned}$$

STEP 5

Load Calculation

$$\begin{aligned} \text{Dead load} &= l \times b \times D \times \gamma \\ &= 1 \times 1 \times 0.63 \times 24 \\ &= 15.12 \text{ KN/m} \\ \text{Live Load} &= 5 \text{ KN/m} \\ \text{Total Load} &= 15.12 + 5 \\ &= 20.12 \text{ KN/m} \\ \text{Factored Load} &= 1.5 \times \text{Total Load} \\ &= 30.18 \text{ KN/m} \end{aligned}$$

STEP 6

Moment Calculation

$$\begin{aligned} M_{ux} &= \alpha_x \times W_u \times L_x^2 \\ M_{uy} &= \alpha_y \times W_u \times L_y^2 \\ \text{From IS 456-2000} & \\ \alpha_x &= 0.074 \\ \alpha_y &= 0.061 \\ M_{ux} &= 0.074 \times 30.18 \times (14.1)^2 \\ &= 444.01 \text{ KNm} \\ M_{uy} &= 0.061 \times 30.18 \times (14.1)^2 \\ &= 366.01 \text{ KNm} \end{aligned}$$

STEP 7

Shear Calculation

$$\begin{aligned} V_{ux} &= 0.5 W_u L_x \\ &= 0.5 \times 30.18 \times 14.1 \\ &= 212.77 \text{ KN} \end{aligned}$$

$$\begin{aligned}
 V_{uy} &= 0.5W_u L_y \\
 &= 0.5 \times 30.18 \times 22.6 \\
 &= 341.03 \text{ KN}
 \end{aligned}$$

STEP 8

$$\begin{aligned}
 M_u &= 0.138 F_{ck} b d^2 \\
 d &= 0.36 \text{ m} < 0.6 \text{ m}
 \end{aligned}$$

Hence Safe

STEP 9

Area of Reinforcement

Shorter Span

$$\begin{aligned}
 M_{ux} &= 0.87 f_y A_{st} d \{1 - [(f_y A_{st}) / (f_{ck} b d)]\} \\
 A_{st} &= 1810.45 \text{ mm}^2 \\
 \text{use 12 mm dia bars} \\
 1. \text{ No. of bars} &= (A_{st} / a_{st}) \\
 &= (1810.45) / (\pi / 4 \times 12^2) \\
 &= 16 \text{ Nos} \\
 2. \text{ Spacing, } S_v &= (a_{st} / A_{st}) \times b \\
 &= [(\pi / 4 \times 12^2) / 1810.45] \times 1000 \\
 &= 70 \text{ mm}
 \end{aligned}$$

Min Spacing is 300 mm

Use 16 Nos of 12mm Dia Bars Spaced at 300mm c/c

Longer Span

$$\begin{aligned}
 M_{uy} &= 0.87 f_y A_{st} d \{1 - [(f_y A_{st}) / (f_{ck} b d)]\} \\
 A_{st} &= 1475.05 \text{ mm}^2 \\
 \text{use 12 mm dia bars} \\
 1. \text{ No. of bars} &= (A_{st} / a_{st}) \\
 &= (1475.05) / (\pi / 4 \times 12^2) \\
 &= 14 \text{ Nos} \\
 2. \text{ Spacing, } S_v &= (a_{st} / A_{st}) \times b \\
 &= [(\pi / 4 \times 12^2) / 1475.05] \times 1000 \\
 &= 75 \text{ mm}
 \end{aligned}$$

Min Spacing is 300 mm

Use 14 Nos of 12mm Dia Bars Spaced at 300mm c/c

STEP 10

Check for Shear

$$\begin{aligned}
 \tau_v &= V_{ux} / b d \\
 &= (212.77 \times 10^3) / (1000 \times 600) \\
 &= 0.35 \text{ N/mm}^2 \\
 p_t &= 100 A_{st} / b d \\
 &= (100 \times 1810.45) / (1000 \times 600) \\
 &= 0.301
 \end{aligned}$$

$$\tau_c = 0.38 \text{ N/mm}^2$$

$$K = 1$$

$$K \tau_c = 0.38 \text{ N/mm}^2$$

$$\tau_{c \text{ max}} / 2 = (3.1 / 2) = 1.55 \text{ N/mm}^2$$

$$\tau_v < K \tau_c < \tau_{c \text{ max}} / 2$$

$$0.35 \text{ N/mm}^2 < 0.38 \text{ N/mm}^2 < 1.55 \text{ N/mm}^2$$

Hence Safe In Shear Reinforcement

STEP 11

Check for Deflection

$$\begin{aligned}
 L/d &= 25 \\
 p_t &= 0.307 \\
 f_s &= 290 \text{ N/mm}^2 \\
 \text{Modification factor} &= 1.2 \\
 d \text{ required} &= \text{span} / (B.V \times M.F) \\
 &= 22000 / (28 \times 1.2) \\
 &= 573 \text{ mm}
 \end{aligned}$$

$$d_{\text{required}} < d_{\text{provided}}$$

$$572 \text{ mm} < 600 \text{ mm}$$

Hence Safe In Deflection

5 DESIGN OF PANTOON TOP SLAB

STEP 1

$$\begin{aligned}
 \text{Given Data} \\
 \text{Size of Slab} &= 16 \text{ m} \times 12 \text{ m} \\
 \text{Depth of Slab} &= 0.45 \text{ m} \\
 \text{Grade used} &= \text{M25, Fe500}
 \end{aligned}$$

STEP 2

$$\begin{aligned}
 \text{Type of Slab} \\
 L_y / L_x &= 16 / 12 \\
 &= 1.33 < 2
 \end{aligned}$$

The Given Slab is Two Way Slab

STEP 3

$$\begin{aligned}
 \text{Overall Depth} \\
 \text{Assume Clear Cover is 30mm} \\
 D &= d + 0.03 \\
 &= 0.45 + 0.03 \\
 &= 0.48 \text{ m}
 \end{aligned}$$

STEP 4

$$\begin{aligned}
 \text{Effective Span} \\
 L_y &= 16 + 0.45 \\
 &= 16.45 \text{ m} \\
 L_x &= 12 + 0.45 \\
 &= 12.45 \text{ m}
 \end{aligned}$$

STEP 5

Load Calculation

Dead load = $l \cdot b \cdot D \cdot \gamma$
 = $1 \cdot 1 \cdot 0.48 \cdot 24$
 = 10.08 KN/m

Another Dead load of Deck Slab= 20.2 KN/mm

Total Load = 10.08+20.2
 = 30.28 KN/m

Factored Load = 1.5 * Total Load
 = 45.42 KN/m

STEP 6

Moment Calculation

$M_{ux} = \alpha_x \cdot W_u \cdot L_x^2$
 $M_{uy} = \alpha_y \cdot W_u \cdot L_y^2$
 From IS 456-2000
 $\alpha_x = 0.093$
 $\alpha_y = 0.055$
 $M_{ux} = 0.093 \cdot 45.42 \cdot (12.45)^2$
 = 654.73 KNm
 $M_{uy} = 0.055 \cdot 45.42 \cdot (12.45)^2$
 = 387.21 KNm

STEP 7

Shear Calculation

$V_{ux} = 0.5 W_u L_x$
 = $0.5 \cdot 45.42 \cdot 12.45$
 = 282.74 KN
 $V_{uy} = 0.5 W_u L_y$
 = $0.5 \cdot 45.42 \cdot 16.45$
 = 373.58 KN

STEP 8

Check For Depth

$M_u = 0.138 F_{ck} b d^2$
 $D = 0.43m < 0.45m$

Hence Safe

Step 9

Area of Reinforcement

1.Shorter Span

$M_{ux} = 0.87 f_y A_{st} d \{1 - [(f_y a_{st}) / (f_{ck} b d)]\}$
 $A_{st} = 4084.45 \text{ mm}^2$
 use 12 mm dia bars
 1. No. of. bars = (A_{st} / a_{st})
 = $(4084.45) / (\pi / 4 \cdot 12^2)$

= 36 Nos
 2. Spacing, $S_v = (a_{st} / A_{st}) \cdot b$
 = $[(\pi / 4 \cdot 12^2) / 4804.45] \cdot 1000$
 = 45 mm

Min Spacing is 300 mm
 Use 36 Nos of 12mm Dia Bars Spaced at 300mm c/c

2.Longer Span

$M_{uy} = 0.87 f_y A_{st} d \{1 - [(f_y a_{st}) / (f_{ck} b d)]\}$
 $A_{st} = 2190.29 \text{ mm}^2$

use 12 mm dia bars

1. No.of.bars = (A_{st} / a_{st})
 = $(2190.29) / (\pi / 4 \cdot 12^2)$
 = 20 Nos

2.Spacing, $S_v = (a_{st} / A_{st}) \cdot b$
 = $[(\pi / 4 \cdot 12^2) / 2190.29] \cdot 1000$
 = 52 mm

Min Spacing is 300 mm

Use 20Nos of 12mm Dia Bars Spaced at 300mm c/c

STEP 10

Check for Shear

$\tau_v = V_{ux} / b d$
 = $(282.74 \cdot 10^3) / (1000 \cdot 450)$
 = 0.62 N/mm²
 $p_t = 100 A_{st} / b d$
 = $(100 \cdot 4804.45) / (1000 \cdot 450)$
 = 1.06
 $\tau_c = 0.64 \text{ N/mm}^2$
 $K = 1$
 $K \tau_c = 0.64 \text{ n/mm}^2$
 $\tau_c \text{ max}/2 = (3.1/2)$
 = 1.55 N/mm²

$\tau_v < K \tau_c < \tau_c \text{ max}/2$
 $0.62 \text{ N/mm}^2 < 0.64 \text{ N/mm}^2 < 1.55 \text{ N/mm}^2$
 Hence Safe In Shear Reinforcement

STEP 11

Check for Deflection

$L/d = 25$
 $p_t = 1.06$
 $f_s = 240 \text{ N/mm}^2$
 Modification factor = 1.0
 $d_{\text{required}} = \text{span} / (B.V \cdot M.F)$
 = $16000 / (28 \cdot 1.0)$
 = 437 mm

$d_{\text{required}} < d_{\text{provided}}$
 $437 \text{ mm} < 450 \text{ mm}$
 Hence Safe In Deflection

6. Design of longer shear wall

Step 1

Given Data

| | | |
|-------------------|---|----------|
| Load | = | 1812 KNm |
| Length of wall | = | 16m |
| Depth of wall | = | 5550m |
| Thickness of wall | = | 320m |

Step 2

Slenderness ratio

| | | |
|-----------|---|--------------------|
| H_e | = | 0.75×5550 |
| | = | 4162.5mm |
| λ | = | 13 |

Step 3

Minimum eccentricity

| | | |
|-----------|---|-------------------|
| e_{min} | = | 0.05 t |
| | = | 0.05×320 |
| | = | 16mm |

Step 4

Additional Eccentricity

$$e_a = \frac{H e^2}{2500 t}$$

$$= 21.65 \text{mm}$$

Step 5

Ultimate load carrying capacity per unit length

| | | |
|-------|---|--|
| P_w | = | $0.3 f_{ck} [t - 1.2 e_{min} - 2e_a]$ |
| | = | $0.3 \times 20 [320 - 1.2 \times 16 - 2 \times 21.65]$ |
| | = | 1545 KN > 1812 KN |

Step 6

Minimum reinforcement

| | | |
|-------|---|-------------------------|
| P_h | = | 0.20% of total c/s area |
| P_v | = | 0.15% of total c/s area |
| A_n | = | 640mm^2 |

As the thickness is more than 150mm the steel has to be palce in two layers of $320 \text{mm}^2/\text{m}$

$$\text{Spacing} = 122.7 \cong 150 \text{mm}$$

Provide 10 mm dia bars at 150mm spacing.

7. Design of shorter shear wall

Step 1

Given Data

| | | |
|----------------|---|------------|
| Load | = | 1087.2 KNm |
| Length of wall | = | 12m |
| Depth of wall | = | 5550m |

$$\text{Thickness of wall} = 320 \text{m}$$

Step 2

Slenderness ratio

| | | |
|-----------|---|--------------------|
| H_e | = | 0.75×5550 |
| | = | 4162.5mm |
| λ | = | 13 |

Step 3

Minimum eccentricity

| | | |
|-----------|---|-------------------|
| e_{min} | = | 0.05 t |
| | = | 0.05×320 |
| | = | 16mm |

Step 4

Additional Eccentricity

| | | |
|-------|---|------------------------|
| e_a | = | $\frac{H e^2}{2500 t}$ |
| | = | 21.65mm |

Step 5

Ultimate load carrying capacity per unit length

| | | |
|-------|---|--|
| P_w | = | $0.3 f_{ck} [t - 1.2 e_{min} - 2e_a]$ |
| | = | $0.3 \times 20 [320 - 1.2 \times 16 - 2 \times 21.65]$ |
| | = | 1545 KN > 1087.2 KN |

Step 6

Minimum reinforcement

| | | |
|-------|---|-------------------------|
| P_h | = | 0.20% of total c/s area |
| P_v | = | 0.15% of total c/s area |
| A_n | = | 640mm^2 |

As the thickness is more than 150mm the steel has to be palce in two layers of $320 \text{mm}^2/\text{m}$

$$\text{Spacing} = 122.7 \cong 150 \text{mm}$$

Provide 10 mm dia bars at 150mm spacing.

7. Design of pontoon Bottom slab

STEP 1

Given Data

| | | |
|---------------|---|------------|
| Size of Slab | = | 16m*12m |
| Depth of Slab | = | 1.6m |
| Grade used | = | M25, Fe500 |

STEP 2

Type of Slab

| | | |
|-----------|---|----------|
| L_y/L_x | = | 16/12 |
| | = | 1.33 < 2 |

The Given Slab is Two Way Slab

STEP 3

$$= 0.5 \times 371.1 \times 17.6$$

$$= 3265.68 \text{ KN}$$

Overall Depth

Assume Clear Cover is 50mm

$$D = d + 0.05$$

$$= 1.6 + 0.05$$

$$= 1.65 \text{ m}$$

STEP 4

Effective Span

$$L_y = 16 + 1.6$$

$$= 17.6 \text{ m}$$

$$L_x = 12 + 1.6$$

$$= 13.6 \text{ m}$$

STEP 5

Load Calculation

Dead load on Bottom Slab = $l \times b \times D \times \gamma$

$$= 1 \times 1 \times 1.65 \times 24$$

$$= 39.6 \text{ KN/m}$$

Dead load & Live load on Deck Slab

$$= 20.12 \text{ KN/m}$$

Dead load on Top Slab = 10.08 KN/m

Dead load on Longer Shear wall

$$= 88.8 \text{ KN/m}$$

Dead load on shorter shear wall

$$= 88.8 \text{ KN/m}$$

Total Load = 247.4 KN/m

Factored Load = 1.5 * Total Load

$$= 371.1 \text{ KN/m}$$

STEP 6

Moment Calculation

$$M_{ux} = \alpha_x \times W_u \times L_x^2$$

$$M_{uy} = \alpha_y \times W_u \times L_y^2$$

From IS 456-2000

$$\alpha_x = 0.093$$

$$\alpha_y = 0.055$$

$$M_{ux} = 0.093 \times 371.1 \times (13.6)^2$$

$$= 6383.39 \text{ KNm}$$

$$M_{uy} = 0.055 \times 371.1 \times (13.6)^2$$

$$= 3775.13 \text{ KNm}$$

STEP 7

Shear Calculation

$$V_{ux} = 0.5 W_u L_x$$

$$= 0.5 \times 371.1 \times 13.6$$

$$= 2523.48 \text{ KN}$$

$$V_{uy} = 0.5 W_u L_y$$

STEP 8

Check For Depth

$$M_u = 0.138 F_{ck} b d^2$$

$$d = 1360.24 \text{ m} < 1600 \text{ m}$$

Hence Safe

Step 9

Area of Reinforcement

1. Shorter Span

$$M_{ux} = 0.87 f_y A_{st} d \{1 - [(f_y A_{st}) / (f_{ck} b d)]\}$$

$$A_{st} = 10567.41 \text{ mm}^2$$

use 25 mm dia bars

1. No. of bars = (A_{st} / a_{st})

$$= (10567.41) / (\pi / 4 \times 25^2)$$

$$= 22 \text{ Nos}$$

2. Spacing, S_v = $(a_{st} / A_{st}) \times b$

$$= [(\pi / 4 \times 25^2) / 10567.41] \times 1000$$

$$= 46.45 \text{ mm}$$

Min Spacing is 300 mm
Use 22 Nos of 25mm Dia Bars Spaced at 300mm c/c

2. Longer Span

$$M_{uy} = 0.87 f_y A_{st} d \{1 - [(f_y A_{st}) / (f_{ck} b d)]\}$$

$$A_{st} = 5852.13 \text{ mm}^2$$

use 25 mm dia bars

1. No. of bars = (A_{st} / a_{st})

$$= (5852.13) / (\pi / 4 \times 25^2)$$

$$= 12 \text{ Nos}$$

2. Spacing, S_v = $(a_{st} / A_{st}) \times b$

$$= [(\pi / 4 \times 25^2) / 5852.13] \times 1000$$

$$= 83.88 \text{ mm}$$

Min Spacing is 300 mm
Use 12 Nos of 25mm Dia Bars Spaced at 300mm c/c

STEP 10

Check For Shear

$$\tau_v = V_{ux} / b d$$

$$= (2523.48 \times 10^3) / (1000 \times 1600)$$

$$= 0.85 \text{ N/mm}^2$$

$$pt = 100 A_{st} / b d$$

$$= (100 \times 10567.41) / (1000 \times 1600)$$

$$= 0.66$$

$$\tau_c = 0.92 \text{ N/mm}^2$$

$$K = 1$$

$$\begin{aligned}K \tau_c &= 0.92 \text{ n/mm}^2 \\ \tau_c \text{ max}/2 &= (3.1/2) \\ &= 1.55 \text{ N/mm}^2\end{aligned}$$

$$\tau_v < K \tau_c < \tau_c \text{ max}/2$$

$$0.85 \text{ N/mm}^2 < 0.92 \text{ N/mm}^2 < 1.55 \text{ N/mm}^2$$

Hence Safe In Shear Reinforcement

STEP 11

Check For Deflection

$$\begin{aligned}L/d &= 25 \\ P_t &= 0.66 \\ f_s &= 290 \text{ N/mm}^2 \\ \text{Modification factor} &= 1.0 \\ d \text{ required} &= 628.57 \text{ mm} < 1600 \text{ mm}\end{aligned}$$

$$d \text{ required} < d \text{ provided}$$

$$437 \text{ mm} < 450 \text{ mm}$$

Hence Safe In Deflection

8. CONCLUSION

According to the above, it should be evident that the pontoon bridges are not just a folkloristic curiosity or a military device, but they represent an effective and economical solution for crossing large stretches of even deep water (lakes, rivers,).

The length of these bridges is not limited by structural or technological problems (such as e.g. for suspension or cable-stayed bridges) and some of them lengthen over than 3000 m (Hobart Bridge). Although pontoon and floating bridges are particularly suitable for use in deepwater, where it would be difficult to build traditional foundations, nevertheless their use generally requires low tidal ranges, small wave motion and moderate currents.

Consider, for example, the semi-submersible pillars, currently used for offshore platforms in deep water, or the buoyant foundations tied to sea bottom by means of high strength tendons, used as support for wind power generation towers.

These devices would reduce the impact of waves and current on the pontoons and would avoid the lowering (however small) of floating supports for moving loads.
