

# Analysis and Design of Primary School building

A.V. Deepanchakaravarthi<sup>1</sup>, S. Nivetha<sup>2</sup>, S. Rajalakshmi<sup>3</sup>

<sup>1</sup>Assistant professor, Civil Department, velammal college of Engineering and Technology, Madurai, Tamilnadu, India.

<sup>2,3</sup>Bachelor of Engineering Student, velammal college of Engineering and Technology, Madurai, Tamilnadu, India

\*\*\*

**Abstract-**Our project is to design a primary school building that can hold a total strength of 500 students, with proper infrastructure provided. Our project is designed to be located at Othakadai village, at the foot hills of anaimalai. This primary school building is designed to benefit the children dwelling in and around Othakadai. The total area of the school building is 6000 sq. meter. It comprises a class rooms, hygienic restrooms for both male and female, lobby, parent's lounge, library, staff room, indoor play area, art room, interactive digital learning room and office room, principal's room, splash area. The design thus obtained is analyzed using STAAD Pro, an analysis software, to check for the shear, bending and tensile conditions. Slab designing is done depending upon the type of slab, end conditions and the loading. From the slabs the loads are transferred to the beams, thereafter the loads from the beams are taken up by the columns and then to footing.

with specific guidelines governing various size various spacing, and exit way.

## II. LITERATURE REVIEW

**1. DINESH RANJAN.S,AISHWARYALAKSHMI.V** "Design and Analysis of an Institutional Building" Volume 1, Issue 2, Mar 2017. The aim of the project is to analyze and design of an institutional building. A lay out plan of the proposed building is drawn by using AUTO CADD 2010. Using this so many standard books analysis of bending moment, shear force, deflection, end moments and foundation reactions are calculated. The structure was analyzed using STAAD.ProV8i. The method we are design the entire structure is limit state Method. The R.C.C. detailing in general shall be as per SP 34 and as per ductile detailing code I.S. 13920.1993. The design was carried as per IS 456:2000 for the above load combinations. As a result, the training, taken through a period of one month allowed to have sample exposure to various field practices in the analysis and design of multi-storeyed buildings and also in various construction techniques used in the school.

**3. Arjunsahu, AnuragVerma, Aryanpaul** "Design and analysis of framed structure. There are several methods for analysis of different frames like cantilever method, portal method, and Matrix method. The present project deals with the design & analysis of an institutional building. The dead load & live loads are applied and the design for beams, columns, footing is obtained STAAD Pro

## I. INTRODUCTION

My project involves analysis and design of PRIMARY SCHOOL BUILDING using very popular designing software STAAD Pro v8i. The total area of the building is 6000 m<sup>2</sup>. The detailed assessment of the primary school building needs and associated capital and operational funding requirements for primary school facility to service. It takes into account the following principles of planning:

The management of play school building, in particular new effective

Management options and their implications, financial modeling and forecasting, and usage/occupancy patterns.

Recommended size and priority components of play school building facility. They relate to financial and other operating outcomes (e.g. social, environmental).

Design and layout of recommended facilities to optimize management and operational benefits.

Integration of building design and location on a major recreation reserve.

Making arrangement: Making arrangements in an industrial chocolate making Layout will be identified as "multiple-aisle". These terms are commonly found in design standards manuals, building codes, and similar architectural reference documents. Each size is unique,

with its new features surpassed its predecessors and computers with its data sharing capabilities with other major software like AUTOCAD.

### III. WORK PROGRESS

#### 3.1 BASIC DATA

Type of construction: Concrete structure

No of stories: 2

Types of walls: brick wall

Floor to floor height: 3m

Walls: 230 mm thick brick masonry walls for both external and internal wall

Materials: Concrete grade:

M20 Steel grades:

HYSD bars of Fe415 grade.

Bearing capacity of soil: 450 k N/m<sup>2</sup>

Details of play school building:

Total area of the building = 6000 sq m

Class Room Size 40 m<sup>2</sup>

Office Room 50 m<sup>2</sup>

Parents lounge 50 m<sup>2</sup>

Canteen 40 m<sup>2</sup>

Library 150 m<sup>2</sup>

Computer Lab 100 m<sup>2</sup>

Craft Room 100 m<sup>2</sup>

Medical Inspection Room 25 m<sup>2</sup>

PET Room 50 m<sup>2</sup>

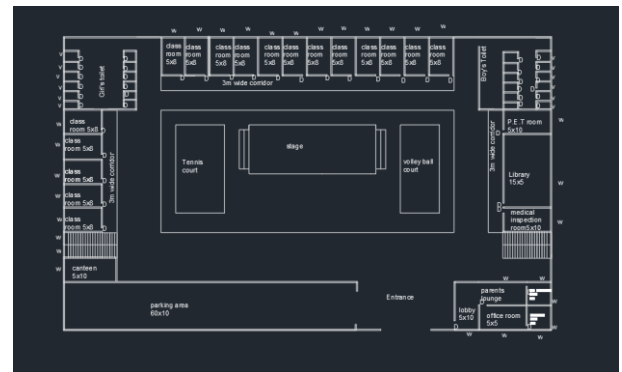

Toilet 225 m<sup>2</sup>

Art Room 100 m<sup>2</sup>

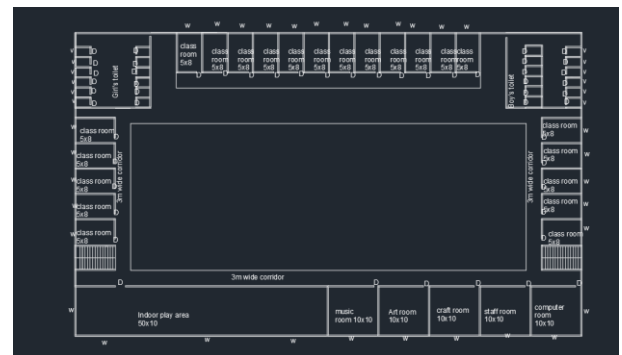

Music Room 100 m<sup>2</sup>

Parking Area 650 m<sup>2</sup>

### 3.2 PLAN OF THE BUILDING

Ground floor plan

First Floor Plan

### IV. DESIGN OF BUILDING COMPONENTS

#### 4.1 DESIGN OF SLAB

##### Data

Concrete grade (f<sub>ck</sub>) = 25 N/mm<sup>2</sup>

Grade of steel (f<sub>y</sub>) = 415 N/mm<sup>2</sup>

Unit weight of concrete = 25 N/mm<sup>2</sup>

Edge condition = Two Short Edges Discontinuous

Assume

Dia of rod used = 10 mm

Clear cover = 20 mm (as per IS 456:2000 table: 16)

Type of Slab

Short span L<sub>x</sub> = 5 m

Longer span L<sub>y</sub> = 8 m

L<sub>x</sub>/ L<sub>y</sub> = 8/5

= 1.6 ≤ 2

It is two way slab

##### Depth of Slab

Span/overall depth = 40 x 0.8

5230/D = 40 X 0.8

D = 156.44 mm

= 165 mm

Effective depth = D - c.c - Φ/2

= 165 - 20 - 10/2

d = 140 mm

Effective Span

Effective span = clear span + effective depth

= 5 + 0.14

= 5.14 mm

### Calculation of Load

Self weight =  $b \times D \times$  unit weight of concrete

=  $1 \times 0.165 \times 25$

= 4.125 Kn/m<sup>2</sup>

Live load = 3 Kn/m<sup>2</sup>

Floor finish = 1 Kn/m<sup>2</sup>

Total load = 8.125 Kn/m<sup>2</sup>

Design load =  $1.5 \times 8.125$

$w = 12.188$  Kn/m<sup>2</sup>

### Ultimate Design Moment and Shear Forces

As per table 26 in IS 456:2000,

$M_x = \alpha_x w l_x$

$M_y = \alpha_y w l_y$

From the boundary conditions panel type is considered and the negative

and positive moment are calculated by using above formula.

$L_y/L_x = 1$

Type of panel is two adjacent edges discontinuous

Negative moment at continuous edge

$\alpha_x = 0.063$

$\alpha_y = 0$

Positive moment at mid span

$\alpha_x = 0.047$

$\alpha_y = 0.035$

Positive Moment

$M_x = \alpha_x w l_x$

=  $0.047 \times 12.18 \times 5.142$

= 15.12 kNm

$M_y = \alpha_y w l_y$

=  $0.035 \times 12.18 \times 5.142$

= 11.26 kNm

Negative Moment

$M_x = \alpha_x w l_x$

=  $0.047 \times 12.18 \times 5.142$

= 20.27 kNm

$M_y = \alpha_y w l_y$

=  $0.0 \times 12.18 \times 5.142$

= 0 kNm

### Shear force

$V_u = 0.5 w l_x$

=  $0.5 \times 12.18 \times 5.14$

= 31.85 Kn

### Check for Depth

$\mu$  limit =  $0.138 f_{ck} b d^2$

=  $15.13 \times 10^6$

=  $0.138 \times 25 \times 1000 \times d^2$

=  $\sqrt{14.689 \times 10^6}$

=  $\sqrt{(0.138 \times 25 \times 1000)}$

= 66.22 mm < 140 mm

Provide a depth of 110mm < 140mm

$d = 110$ mm;  $D = 135$ mm

Hence the effective depth selected is sufficient to resist the design ultimate moment.

### Reinforcement

From IS 456:2000

$\mu = 0.87 f_y A_{st} d (1 - A_{st} f_y / b d f_{ck})$

$15.12 \times 10^6 = 0.87 \times 415 \times A_{st} \times 110 \times (1 - A_{st} \times 415 / 1000 \times 110 \times 25)$

$15.13 \times 10^6$

=  $39715.5 A_{st} - 7.49 A_{st}^2$

( $1 - A_{st} f_y / b d f_{ck}$ )

$11.26 \times 10^6 = 0.87 \times 415 \times A_{st} \times 110 \times (1 - A_{st} \times 415 / 1000 \times 110 \times 25)$

$11.27 \times 10^6$

=  $39715.5 A_{st} - 7.49 A_{st}^2$

$A_{st} = 300.5$  mm<sup>2</sup>

Minimum reinforcement =  $0.12\% B_d$  (as per 26.5.2.1)

=  $0.12 / 100 \times 1000 \times 135$

= 162 mm<sup>2</sup>

Adopt 10mm diameter bars,

Spacing =  $(\pi / 4 \times 10^2$

$/ 412) \times 1000$

= 190 mm

Provide,

10 mm bars at 190 mm center's ( $A_{st} = 341.484$  mm<sup>2</sup>) in short span direction.

10 mm bars at 260 mm center's ( $A_{st} = 246.87$  mm<sup>2</sup>) in longer span direction.

### sCHECK FOR SHEAR

Considering the short span and unit width of slab.

$\tau_v = V_u / b d$  (as per clause 40.1 page no.72)

=  $31.32 \times 10^3$

$/ 1000 \times 110$

= 0.285 N/mm<sup>2</sup>

$P_t = 100 A_{st} / b d$

=  $100 \times 412 / 1000 \times 110$

= 0.3

Refer table 19 in IS 456:2000 for  $p_t = 0.31$

= 0.384

From IS 456:200 clause 40.2.1.1

$\tau_{ck} = 1.30 \times 0.384$

=  $0.499 > 0.296$

$K \tau_c > \tau_v$

Hence the shear stresses are within safe permissible limits.

### Check for Deflection Control

Considering unit width of slab

( $L/d$ ) basic = 26

( $L/d$ ) max = ( $L/d$ ) basic  $\times k_t$

$f_s = 0.58 f_y A_{st}(\text{req}) / A_{st}(\text{prov})$

= 231.70

From SP16 table 3 page no: 49

$p_t = 0.3\%$

As per IS 456:2000 pg.38 fig 4

$K_t = 1.5$

From fig 4 IS 456:2000 page no: 38,  $K_t = 1.5$

( $L/d$ ) max = ( $L/d$ ) basic  $\times K_t$

=  $40 \times 1.5 = 60$

( $L/d$ ) actual =  $5140 / 110 = 46.82 < 60$

Hence the limit state of deflection is satisfied

$$= 144420A_{st}(1-2.075 \times 10^{-4}A_{st})$$

$$45.09 \times 10^6$$

$$= 144420A_{st} - 29.96A_{st}^2$$

$$A_{st} = 335 \text{ mm}^2$$

$$\text{No of bars required} = 335 \times 4 / 3.14 \times 16^2$$

$$= 2$$

Provide 2 nos of 16 mm dia bar

$$A_{st}(\text{prov}) = 402.12 \text{ mm}^2$$

Minimum Reinforcement :

As per IS 456:2000 Cl.no 26.5.1.1\

$$A_{st \text{ min}} = 0.85 / f_y \times b \times d$$

$$= 0.85 / 415 \times 230 \times 400$$

$$= 188 \text{ mm}^2$$

<A<sub>st</sub>prov

Hence Safe

Adopt 8 mm dia vertical stirrups @ 300 mm c/c spacing.

### Beam Reinforcement

### 4.3 DESIGN OF COLUMN

Column (Column under Axial Compression)

#### DATA

Size of column = 250 mm x 250 mm

Length of column, L = 3 m

Eff. Length, L<sub>eff</sub> = 0.65 x 3 (as per IS 456:2000 table 28)

### Slab Reinforcement

#### 4.2 DESIGN OF BEAM

Size of beam = 250 x 450 mm

Span(effective) = 5.23 m

L.L = 3KN/m

D.L = 2.82 + 4.375 = 7.195KN/m

#### DIMENSION:

Cover depth d' = 50 mm

Effective depth = d = D - d'

$$= 450 - 50 = 400 \text{ mm}$$

#### MOMENT CALCULATION:

$$M_u(-ve) = 1.5((Wd l_2 / 10) + (Wd l_2 / 9))$$

$$= 1.5 ((7.195 \times 5.23 / 9) + (3 \times 5.23 / 10))$$

$$= 45.09 \text{ KNm}$$

$$M_u(-ve) = 1.5((Wd l_2 / 12) + (Wd l_2 / 10))$$

$$= 1.5 ((7.195 \times 5.23 / 10) + (3 \times 5.23 / 12))$$

$$= 39.78 \text{ KNm}$$

$$M_u \text{ lim} = 0.138 f_{ck} b d^2$$

$$= 0.138 \times 20 \times 250 \times 400^2$$

$$= 110 \text{ KNm}$$

$$M_u < M_u \text{ lim}$$

#### Main Reinforcement:

$$M_u = 0.87 \times f_y \times A_{st} \times d(1 - (A_{st} f_y / b d f_{ck}))$$

$$45.09 \times 10^6$$

= 1.95 m

Grade of concrete  $f_{ck} = 20 \text{ N/mm}^2$

Grade of steel  $f_y = 415 \text{ N/mm}^2$

Diameter of rod used = 12 mm

Clear cover = 40 mm

Effective cover  $d' = 50 \text{ mm}$

Type of column

$L_{eff}/d = 1950/250 = 7.8$

$L_{eff}/D = 1950/250 = 7.8$  (as per IS 456:2000 clause 25.1.2)

Since  $L_{eff}/d$  and  $L_{eff}/D$  are less than 12. It is a short column.

Data taken from STAAD Pro analysis,

$F_y = 294.28 \text{ Kn}$

Longitudinal Reinforcement

Axial load,  $P_u = 294.28 \text{ kN}$

$P_u = 0.4f_{ck}ng + (0.67f_y - 0.4f_{ck}) \text{ ASC}$

$294.28 \times 10^3 = 0.4 \times 20 \times (250 \times 250) + (0.67 \times 415 - 0.4 \times 20) \text{ ASC}$

$294.28 \times 10^3 = 500000 + (278.05 - 8) \text{ ASC}$

$\text{ASC} = 761.9 \text{ mm}^2$

No. of bars =  $761.9 / (\pi/4 \times 12^2)$

)

= 6.7 = 8 bars

### Lateral Ties

As per IS 456:2000 clause 26.5.3.1 (c)

### Pitch

☑ 300 mm

☑  $16 \times 12 = 192 \text{ mm}$

☑ 300 mm

Provide spacing of 300 mm.

Tie Diameter

☑  $1/4 \times 12 = 3 \text{ mm}$

☑ Not less than 6 mm

Provide 8 mm ties.

### Column (Column under Uni Axial Compression)

Size of column = 250 mm x 250 mm

Length of column,  $L = 3 \text{ m}$

Eff. Length,  $L_{eff} = 0.65 \times 3$  (as per table 28, IS 456:2000) = 1.95 m

Grade of concrete  $f_{ck} = 20 \text{ N/mm}^2$

Grade of steel  $f_y = 415 \text{ N/mm}^2$

Diameter of rod used = 12 mm

$P_u = 294.28 \text{ kN}$

$M_u = 10.2 \text{ kNm}$

Type of column

$L_{eff}/d = 1950/250 = 7.8$

$L_{eff}/d = 1950/250 = 7.8$  (refer clause 25.1.2, IS 456:2000)

42

Since  $L_{eff}/d$  and  $L_{eff}/D$  are less than 12. It is a short column.

Data taken from STAAD Pro analysis,

$F_y = 294.28 \text{ kN}$

Non Dimensional Parameters

$P_u/f_{ck}bd = 294.28 \times 10^3$

$/ (20 \times 250^2)$

= 0.24

$M_u/f_{ck}bd^2$

=  $6.7 \times 10^6$

$/ (20 \times 250^3) = 0.03$

Longitudinal Reinforcement

Refer chart 34 of SP:16 ( $d'/D = 0.2$  and  $f_y = 415 \text{ N/mm}^2$ )

$P/f_{ck} = 0.18$

$P = 0.18 \times 20$

= 3.6

$$A_{sc} = p_b D^2 / 100$$

$$= (3.6 \times 2502$$

$$) / 100$$

$$= 2250 \text{ mm}^2$$

$$\text{No. of bars} = 2250 / (\pi/4 \times 12^2)$$

$$= 19.89$$

$$= 19 \text{ bars}$$

### Lateral Ties

Tie diameter

$$(i) 1/4 \times 12 = 3 \text{ mm}$$

$$(ii) \text{ Not less than } 6 \text{ mm}$$

Provide two legged 8 mm ties.

Pitch

$$(i) 300 \text{ mm}$$

$$(ii) 16 \times 12 = 192 \text{ mm}$$

$$(iii) 300 \text{ mm}$$

Provide spacing of 300 mm

### Column (Column under Biaxial Compression)

Size of column = 250 mm x 250 mm

Length of column,  $L = 3 \text{ m}$

Eff. Length  $L_{eff} = 0.65 \times 3$

$= 1.95 \text{ m}$  (As per table 28, IS 456:2000)

Grade of concrete  $f_{ck} = 20 \text{ N/mm}^2$

Grade of steel  $f_y = 415 \text{ N/mm}^2$

Diameter of rod used = 12 mm

Clear cover = 40 mm

Effective cover  $d' = 50 \text{ mm}$

Type of Column

$$L_{eff}/d = 1950/250 = 6.5$$

$$L_{eff}/D = 1950/250 \text{ (As per clause 25.1.2, IS 456:2000)} = 3.9$$

Since  $L_{eff}/d$  and  $L_{eff}/D$  are less than 12. It is a short column.

Data taken from STAAD pro analysis,

$$F_y = 294.28 \text{ kN}$$

Design of Compression Member Subjected To Biaxial Bending

$$\text{Axial load } P_u = 294.28 \text{ KN}$$

$$\text{Moment } M_z = 6.37 \text{ kNm}$$

$$\text{Moment } M_y = 3.28 \text{ kNm}$$

$$\text{Assume } P_u = 4\%$$

$$P_t/f_{ck} = 4/20 = 0.2$$

Uniaxial moment capacity of the section about XX axis

$$d' = 40 + 20/2 = 50$$

$$D = 250 \text{ mm}$$

$$d'/D = 50/250 = 0.2$$

$$P_u/f_{ck} b = (294.28 \times 10^3) / (20 \times 250^2)$$

$$= 0.23$$

Referring chart No. 44,

$$M_u/f_{ck} b D^2$$

$$= 0.03$$

Uniaxial moment capacity of the section about X-X axis

$$M_{ux1} = 0.03 \times 20 \times 250 \times 250^2$$

$$= 9.375 \text{ kNm}$$

Uniaxial moment capacity of the section about Y-Y axis

$$d'/D = 50/250 = 0.175$$

Chart for  $d'/D = 0.175$  will be used

Referring chart,

$$M_u/f_{ck} b d^2$$

$$= 0.018$$

$$M_{uy1} = 0.018 \times 20 \times 250 \times 250^2$$

$$= 5.625 \text{ kNm}$$

Calculation of  $P_{uz}$

From chart 63 corresponding to,

$$P_t = 4\%$$

$$f_y = 415 \text{ N/mm}^2$$

$$f_{ck} = 20 \text{ N/mm}^2$$

$$P_{uz} / A_g = 24 \text{ N/mm}^2$$

$$P_{uz} = 24 \times 250 \times 250$$

$$P_{uz} = 1500 \text{ kN}$$

$$P_u / P_{ux} = 294.28 / 1500 = 0.196$$

$$M_{ux} / M_{ux1} = 6.37 / 9.375 = 0.68$$

$$M_{uy} / M_{uy1} = 3.28 / 5.625$$

$$= 0.58$$

Referring to chart 64, the permissible value of  $M_{ux} / M_{ux1}$  corresponding to the above

values of  $M_{uy} / M_{uy1}$  and  $P_u / P_{ux}$  is equal to 1

Corresponding to the above values of  $M_{uy} / M_{uy1}$  and  $P_u / P_{ux}$ , the permissible value of  $M_{ux} / M_{ux1}$  is 1. Hence the section is O.K.

$$A_s = (p_x b \times D) / 100$$

$$= (4 \times 250 \times 250) / 100$$

$$= 2500 \text{ mm}^2$$

Use 12 mm dia bars,

$$\text{No. of bars required} = A_{st} / \text{area of 1 bar}$$

$$= 2500 / ((\pi/4) \times 12^2)$$

$$= 18$$

The diameter,

$$(i) 1/4 \times 12 = 3 \text{ mm}$$

$$(ii) \text{ Not less than } 6 \text{ mm}$$

Provide two legged 8 mm ties.

Pitch

$$(i) 300 \text{ mm}$$

$$(ii) 16 \times 12 = 192 \text{ mm}$$

$$(iii) 300 \text{ mm}$$

Provide spacing of 300 mm.

### Column Reinforcement

#### 4.4 DESIGN OF STAIRCASE

Height between floors = 3 m

Tread = 270 mm

Rise = 160 mm

Landing width = 1.25 m

Live load = 3 KN/m

F.F = 1 KN/m

Wall thickness = 250 mm

#### DIMENSIONS:

R=160 mm

T=270 mm

No. of steps =  $3 / 0.16 = 18$  steps

In case of dog legged staircase, 9 nos of steps for 1st flight and other 9 nos of steps

for 2nd flight.

$$\text{Effective span} = 0.25/2 + 1.25 + (8 \times 0.27) + 1.25 + 0.25/2$$

$$= 4.91 \text{ m}$$

$$\text{Slab thickness} = l_{eff} / 20 = 4.91 / 20 = 245 \text{ mm}$$

Assume cover 20mm & 12mm dia bars

$$d_{eff}(\text{landing}) = 245 - 20 - 12/2 = 219 \text{ mm}$$

#### LOAD CALCULATION:

$$\text{Dead load of slab on slope } W_s = 0.245 \times 1 \times 25$$

$$= 6.125 \text{ KN/m}$$

Dead load of slab on horizontal span

$$W = W_s \sqrt{R^2 + T^2} / T$$

$$W = 6.125 \sqrt{0.162^2 + 0.272^2} / 0.27 = 0.70 \text{ KN/m}$$

$$\text{Dead load on one step} = 0.5 \times 0.16 \times 0.27 \times 25$$

$$= 0.54 \text{ KN/m}$$

$$\text{Loads of steps per metre length} = 0.54 \times 1000 / 220 = 2.45 \text{ KN/m}$$

$$F.F = 1 \text{ KN/m}$$

$$\text{Total load} = 9.7 \text{ KN/m}$$

$$L.L = 3 \text{ KN/m}$$

$$\text{Factored load} = 19.05 \text{ KN/m}$$

**MOMENT CALCULATION:**

$$M = 0.125 W l^2$$

$$= 0.125 \times 19.05 \times 4.912^2$$

$$= 57.40 \text{ KNm}$$

**CHECK FOR DEPTH:**

$$d = \left( \frac{M_u}{0.138 f_{ck} b} \right)^{1/2}$$

$$= 144.21 < 219 \text{ mm}$$

Hence Safe

**MAIN REINFORCEMENT:**

$$M_u = 0.87 \times f_y \times A_{st} \times d \left( 1 - \frac{A_{st} f_y}{b d f_{ck}} \right)$$

$$57.40 \times 10^6$$

$$= 0.87 \times 415 \times A_{st} \times 144.21 \left( 1 - \frac{A_{st} \times 415}{1000 \times 147 \times 20} \right)$$

$$57.40 \times 10^6$$

$$= 53334.30 A_{st} - 7.49 A_{st}^2$$

$$M_u = 1310 \text{ Nmm}$$

Provide 12 mm dia @200mm c/c

**DISTRIBUTION REINFORCEMENT:**

$$= 0.12\% \text{ cross section}$$

$$= 0.0012 \times 1000 \times 2 = 2.4 \text{ mm}^2$$

Provide 10 mm dia bars @ 300 mm c/c

**Staircase Reinforcement**

**4.5 DESIGN OF FOOTING**

$$\text{Load on column} = 249.28 \text{ KN}$$

$$\text{Extra load at 10\% of load due to self wt of soil} = 300 \text{ KN}$$

$$\text{Therefore total load } P = 549.28 \text{ KN}$$

$$\text{Area} = P / \text{SBC} = 549.28 / 450 = 1.22 \text{ m}^2$$

$$\text{Area of footing} = 7.5 \text{ m}^2$$

$$\text{Upward soil Pressure} = \frac{249.28}{(2.75 \times 2.75)} = 40.6 \text{ KN/m}^2$$

**Two Way Shear:**

$$\text{Uniform overall thickness of footing } D = 500 \text{ mm}$$

Assuming 16mm dia bars for main steel, effective depth of footing

$$d = 500 - 50 - 8 = 442 \text{ mm}$$

punching shear occurs at a distance of  $d/2$  from the face of the column,

where  $a$  and  $d$  are the dimensions of the column

$$\text{Hence, punching area of footing} = (a+d)^2$$

$$= (0.25 + 0.452)^2 = 0.702 \text{ m}^2$$

$$\text{Punching shear force} = \text{factored load} - (\text{factored average pressure} \times$$

$$\text{punching area of footing})$$

$$= 4500 - (654.54 \times 0.702)$$

$$= 4040 \text{ KN}$$

$$\text{Perimeter along the section} = 4(a+d)$$

$$= 4(250 + 452) = 2808 \text{ mm}$$

Punching shear force

$$0.5 \times (l-a) \cdot 60$$

Nominal shear stress = perimeter x effective thickness

$$= 0.5 \times (2750-250) \cdot 60$$

$$= 4040 \times 103 / 2808 \times 452 = 3.18 \text{ N/mm}^2$$

$$= 1190 > L_d$$

Allowable shear stress =  $K_s \times T_c$

Hence Ok.

$$T_c = 0.25 \text{ SQRT}(f_{ck})$$

$$= 1.1 \text{ N/mm}^2$$

$$K_s = 0.5 + 0.25/0.25 = 1.5$$

$$\text{Allowable shear stress} = 1.1 \times 1.5 = 1.65 \text{ N/mm}^2$$

$$1.1 < 1.65 \text{ N/mm}^2$$

Hence assumed thickness of footing is sufficient.

**Footing Reinforcement**

**S**

$$P_u \text{ max} = 436.36 \text{ KN}$$

$$= 2750 - 450 / 2$$

$$= 1150 \text{ mm}$$

$M_u$  = total force x distance from the section

$$= 180 \text{ KN/m}^2$$

$$M_u / b d^2$$

$$= P_t = 0.625\% \text{ ( from sp-16)}$$

$$A_{st} = P_t \times b \times d$$

$$= 0.625 \times 2.75 \times 2.75$$

$$= 1171.1 \text{ mm}^2 / \text{m width}$$

**CHECK FOR ONE WAY SHEAR:**

$$V_u = \text{total force} \times (1-d) \times B$$

$$= 436.36 \times (1.5 - 0.452) \times 2.75$$

$$= 1259 \text{ KN}$$

$$\text{Nominal shear stress} = V_u / (B \times d) = 1257 / (2.75 \times 2.75)$$

$$= 0.16 \text{ N/mm}^2$$

**CHECK FOR DEVELOPMENT LENGTH:**

The development length for 16 mm dia bars is given by

$$L_d = 47 \times d = 47 \times 16 = 752 \text{ mm}$$

Providing 60 mm side cover, the total length available from the section is

**V. ANALYSIS USING STAAD-PRO:**

**Structural View of the building**

**3D view of the building**

**Load Distribution diagram**

## VI. CONCLUSION

We have learnt the methodology of constructing a high rise building by following all the codal provisions and to know the method of application of specification concepts for the design. We can conclude that there is difference between the theoretical and practical work done. As the scope of understanding will be much more when practical work is done. As we get more knowledge in such a situation where we have great experience doing the practical work. Knowing the loads we have designed the slabs depending upon the ratio of longer to shorter span of panel. In this project we have designed slabs as two way slabs depending upon the end condition, corresponding bending moment. The coefficients have been calculated as per I.S. code methods for corresponding  $l_x/l_y$  ratio. The calculations have been done for loads on beams and columns and designed frame analysis by moment distribution method. Here we have a very low bearing capacity, hard soil and isolated footing done.
